The Patient View should consist of a simple indicator showing their center of gravity. In order to keep patient from being overwhelmed, all other data (quadrant weight distribution, total weight, etc) should be displayed on a separate screen not visible to the patient.

The physical therapist may also view this window.
The Physical therapist view should graphically show the weight distributions for each quadrant of the balance board in real time. Additionally information regarding the total weight, and center of gravity should be shown. COG information will be redundant (in both Patient and PT views) so it may only be necessary to show this information textually on this screen. Additionally there should be some metadata entered here (using text-boxes)

This screen will also be used for playback capability
